

A well-oiled machine

Is your site running as efficiently as it can?

Whenever equipment runs needlessly while you wait for something else to happen – like material to arrive or a decision to be made – energy is wasted. Optimising your production processes and understanding downtime saves energy. Clean outs and over spills can add up to 20% of a site's total energy costs – cut them in half and save 10% on your energy.

Can you streamline any of your processes?
